Dear Sir or Madam,

The Road Management and City Maintenance Authority in Wrocław with participation of the State Water Holding Polish Waters / the Regional Water Management Authority in Wrocław, in reference to your correspondence received by e-mail under the public consultation of the Draft Environmental Management Plan for Contract 1B.9 *Modernization of the flood embankment along the Ślężoujście Street with road infrastructure*, kindly informs that the use of fencing preventing amphibians from crossing the road is planned at the initial stage, however, its final form will be specified at the performance of works. It should be kept in mind that the embankment to be redeveloped is a flood barrier, which - as a rule - must be a watertight construction.

Additionally, it should be noted that:

- At the stage of the investment implementation it will be possible to implement further recommendations aimed to protect the natural resources and biodiversity within the area. Pursuant to the provisions of Appendix No. 1 to the Draft EMP, among others, nature supervision is planned to be provided by a multi-discipline team of environmental experts (Item 88 of Appendix 1). This team will not only be responsible for performing a nature inventory prior to the start of works, but will also inspect the construction site, on an ongoing basis, throughout the works, which will allow for the ongoing implementation of recommendations minimising the impact on nature.
- In relation to the works performed within the Ługowina river and in the vicinity of local water reservoirs, a herpetologist is also projected to join the expert team, who will watch over the protection of amphibians, inspect the construction site on an ongoing basis and recommend any necessary protective measures, including assisting the Developing Company in specifying the scope of fencing to be installed at the operational stage of the Project.

Regards,
